PointerScore 100

A practical guide for getting started: Understand the method, find the right metrics, and use the calculator in a structured way.

This handbook shows you what you do with PointerScore, which data you need, and how the evaluation process works. The exact point allocation and full calculation logic remain part of the PointerScore Calculator.

What is PointerScore?

PointerScore is a structured 100-point system for evaluating companies. It helps you bring company data into a clear framework instead of only looking at it. Rather than relying on gut feeling, hype, or individual metrics, you evaluate a company systematically across five areas.

Evaluation area	Weighting
Future	25 points
Growth	25 points
Financial stability	20 points
Valuation	10 points

Important: You enter the relevant company metrics yourself. PointerScore then handles the structured calculation and classification for you.

The goal is not to blindly replace an investment decision. Instead, PointerScore is designed to help you view companies more clearly, more transparently, and more comparably.

Who is PointerScore for?

PointerScore is especially useful for private investors who want to understand companies better and evaluate them in a more structured way. You do not need to be a professional - what matters most is that you are willing to work with real company data.

1 Beginners

You want clear guidance instead of YouTube hype, gut feeling, or FOMO.

2 More experienced investors

You already know key metrics and want to use a consistent evaluation framework.

3 Long-term investors

You are looking for a method to make companies comparable over longer periods of time.

PointerScore is particularly useful if you want to review companies step by step - not if you just want to follow a quick tip.

It is especially helpful when you want to compare several companies using the same method. This allows you to recognize differences faster and justify your selection more clearly.

Which company data do you need?

For PointerScore to work meaningfully, you need a few key company metrics. These inputs form the basis for the five evaluation areas.

Metric	Why it matters
Industry	Needed to assess future potential.
Market position	Shows how strongly a company is positioned in the market.
Revenue from the last 3 fiscal years	Basis for the growth evaluation.
Profit from the last 3 fiscal years	Adds earnings development to the growth analysis.
Total debt & total assets	Important for balance sheet strength and stability.
Current revenue & current profit	Used, among other things, to assess profitability.
P/E ratio	Helps assess the company's current valuation.
ROE or ROIC	Shows how efficiently invested capital is converted into profits.

Tip: Collect the data in one place first. This makes later input into the PointerScore Calculator much faster and cleaner.

Where can you find this data?

Most required metrics are publicly available. The important thing is to use sources that are as reliable and consistent as possible.

01 Annual reports

Very reliable. Here you find the official figures published by the company.

02 Investor relations pages

Often the best place to find current company data and presentations.

03 Financial portals

Useful for a quick overview of revenue, profit, P/E ratio, or ROE/ROIC.

04 Quarterly reports

Useful if you also want to keep an eye on current developments.

05 Investor presentations

Helpful for assessing market position and strategic priorities.

06 Compare multiple sources

If figures differ strongly, a quick cross-check is worthwhile.

Use consistent data sources whenever possible. This makes your evaluations more comparable and reduces unnecessary errors.

For beginners: Start with a few clear sources. Using too many portals at once often makes the evaluation more confusing.

How does an evaluation work?

The use of PointerScore follows a simple process. This makes it easy to keep track of the process, even as a beginner.

The process in practice

- Select a company.
- Collect important metrics.
- Enter data into the PointerScore Calculator.
- Have the score calculated automatically.
- Classify the result and analyze further if needed.

PointerScore is strongest when you use it as a filter: first evaluate in a structured way, then take a deeper look at interesting companies.

What do the results mean?

The final score gives you a quick and understandable classification. It does not replace your own thinking, but it shows at a glance how strong a company appears according to the PointerScore logic.

Score range	Meaning
80-100 points	Strong PointerScore signal. The company appears fundamentally solid and interesting.
60-79 points	Watch. The company may be interesting, but should be reviewed more closely.
Below 60 points	Weaker signal. According to PointerScore, there are clear weaknesses or open questions.

A high score does not automatically mean buy, and a lower score does not automatically mean never invest. The score is a tool for better decisions and not a guarantee.
